

Final-year Software Engineering student with experience in academic and personal software projects. Interested in software engineering, frontend development, and AI-driven applications.

Selected Projects

ChronoLogic — Neuro-Symbolic AI Productivity & Task Scheduling System Feb 2026–Apr 2026

Technologies: Python, AI, Machine Learning

- Developing a research-based productivity and task scheduling system using neuro-symbolic AI concepts.
- Exploring intelligent scheduling techniques for constraint-aware task management.
- Designing the system architecture and researching suitable AI models.

AgroVision — AI-Powered Plant Disease Detection & Crop Advisory System Academic Project | 2026

Technologies: Python, Machine Learning

- Designed an AI-based concept for identifying plant diseases from crop images.
- Planned a crop advisory system to provide disease information and recommendations.
- Focused on applying AI to solve real-world agricultural challenges.

Desktop Task Manager (Java Swing) Personal Project | 2025

Technologies: Java, Java Swing

- Built a desktop task management application using Java Swing.
- Implemented task creation, editing, deletion, and completion features.
- Improved understanding of Java GUI development and object-oriented programming.

Education and Activities

- **Bachelor of Science in Software Engineering Daffodil International University** Expected Graduation 2026
- **NASA International Space Apps Challenge Participant** 2025

Technologies and Languages

- JavaScript, Python, Java, React, HTML5, CSS3,
- Tailwind CSS, MySQL, Git, GitHub,
- VS Code, Vite, npm
